(54) Title: THERAPEUTIC COMPOUNDS

(57) Abstract: The present invention provides compounds of formula (I): wherein all variables are as defined herein, pharmaceutical compositions containing the same, processes for preparing the same and their use as pharmaceutical agents.

WO 02/48147 A2

45

THERAPEUTIC COMPOUNDS

BACKGROUND OF THE INVENTION

- 5 The present invention relates to novel compounds, pharmaceutical formulations comprising these compounds, and the use of these compounds in therapy. More particularly, the present invention relates to compounds for the prophylaxis and treatment of herpes viral infections.
- 10 Of the DNA viruses, those of the herpes group are the sources of the most common viral illnesses in man. The group includes herpes simplex virus types 1 and 2 (HSV), varicella zoster virus (VZV), cytomegalovirus (CMV), Epstein-Barr virus (EBV), human herpes virus type 6 (HHV-6), human herpes virus type 7 (HHV-7) and human herpes virus type 8 (HHV-8). HSV-1 and HSV-2 are some of the most common infectious
- 15 agents of man. Most of these viruses are able to persist in the host's neural cells; once infected, individuals are at risk of recurrent clinical manifestations of infection which can be both physically and psychologically distressing.
- Herpes simplex viruses (HSV-1 and -2) are the causative agents of herpes labialis and
- 20 genital herpes. HSV infection is often characterised by extensive and debilitating lesions of the skin, mouth and/or genitals. Primary infections may be subclinical although tend to be more severe than infections in individuals previously exposed to the virus. Ocular infection by HSV can lead to keratitis or cataracts thereby endangering the host's sight. Infection in the new-born, in immunocompromised
- 25 patients or penetration of the infection into the central nervous system can prove fatal. In the US alone, 40 million individuals are infected with HSV-2, a number that is expected to increase to 60 million by 2007. Over 80% of individuals infected with HSV-2 are unaware they carry and spread the virus, and of those diagnosed less than 20% received oral therapies. The net result is that less than 5% of the infected
- 30 population are treated. Likewise of the 530 million individuals worldwide who carry the HSV-1 virus, 81% of the symptomatic population remain untreated. No cure

exists for HSV infection, and once infected, individuals carry the virus for life in a dormant state. Reactivation of the virus from latency occurs periodically and may be triggered by stress, environmental factors, and/or suppression of the host immune system. Currently, the use of nucleoside analogs such as valaciclovir (VALTREX®) and
5 aciclovir (ZOVIRAX®) is the standard of care for managing genital herpes virus outbreaks.

VZV is a herpes virus which causes chickenpox and shingles. Chickenpox is the primary disease produced in a host without immunity, and in young children is usually a mild
10 illness characterised by a vesicular rash and fever. Shingles or zoster is the recurrent form of the disease which occurs in adults who were previously infected with VZV. The clinical manifestations of shingles are characterised by neuralgia and a vesicular skin rash that is unilateral and dermatomal in distribution. Spread of inflammation may lead to paralysis or convulsions. Coma can occur if the meninges become affected. VZV
15 is of serious concern in patients receiving immunosuppressive drugs for transplant purposes or for treatment of malignant neoplasia and is a serious complication of AIDS patients due to their impaired immune system.

In common with other herpes viruses, infection with CMV leads to a lifelong
20 association of virus and host. Congenital infection following infection of the mother during pregnancy may give rise to clinical effects such as death or gross disease (microcephaly, hepatosplenomegaly, jaundice, mental retardation), retinitis leading to blindness or, in less severe forms, failure to thrive, and susceptibility to chest and ear infections. CMV infection in patients who are immunocompromised for example as a
25 result of malignancy, treatment with immunosuppressive drugs following transplantation or infection with Human Immunodeficiency Virus, may give rise to retinitis, pneumonitis, gastrointestinal disorders and neurological diseases. CMV infection is also associated with cardiovascular diseases and conditions including restenosis and atherosclerosis.

The main disease caused by EBV is acute or chronic infectious mononucleosis (glandular fever). Examples of other EBV or EBV associated diseases include lymphoproliferative disease which frequently occurs in persons with congenital or acquired cellular immune deficiency, X-linked lymphoproliferative disease which
5 occurs namely in young boys, EBV-associated B-cell tumours, Hodgkin's disease, nasopharyngeal carcinoma, Burkitt lymphoma, non-Hodgkin's lymphoma, thymomas and oral hairy leukoplakia. EBV infections have also been found in association with a variety of epithelial-cell-derived tumours of the upper and lower respiratory tracts including the lung. EBV infection has also been associated with other diseases and
10 conditions including chronic fatigue syndrome and multiple sclerosis.

HHV-6 has been shown to be a causative agent of infantum subitum in children and of kidney rejection and interstitial pneumonia in kidney and bone marrow transplant patients, respectively, and may be associated with other diseases such as multiple
15 sclerosis. There is also evidence of repression of stem cell counts in bone marrow transplant patients. HHV-7 is of undetermined disease aetiology.

Hepatitis B virus (HBV) is a viral pathogen of world-wide major importance. The virus is aetiologically associated with primary hepatocellular carcinoma and is thought to
20 cause 80% of the world's liver cancer. Clinical effects of infection with HBV range from headache, fever, malaise, nausea, vomiting, anorexia and abdominal pains. Replication of the virus is usually controlled by the immune response, with a course of recovery lasting weeks or months in humans, but infection may be more severe leading to persistent chronic liver disease outlined above.

20

The term "solvate" as used herein refers to a complex of variable stoichiometry formed by a solute (a compound of formula (I)) and a solvent. Solvents, by way of example, include water, methanol, ethanol, or acetic acid.

25 The term "physiologically functional derivative" as used herein refers to any pharmaceutically acceptable derivative of a compound of the present invention, for example, an ester or an amide of a compound of formula (I), which upon administration to an animal, particularly a mammal, such as a human, is capable of providing (directly or indirectly) a compound of the present invention or an active metabolite thereof. See for example, Burger's Medicinal Chemistry And Drug
30 Discovery, 5th Edition, Vol 1: Principles And Practice.

Processes for preparing pharmaceutically acceptable salts, solvates and physiologically functional derivatives of the compounds of formula (I) are conventional in the art.

See, e.g., Burger's Medicinal Chemistry And Drug Discovery 5th Edition, Vol 1: Principles And Practice.

Those terms as applied to any intermediate employed in the process of preparing compounds of formula (I) have the same meanings as noted above with respect to compounds of formula (I). Certain compounds of formula (I) may exist in stereoisomeric forms (e.g. they may contain one or more asymmetric carbon atoms or may exhibit *cis-trans* isomerism). The individual stereoisomers (enantiomers and diastereomers) and mixtures of these are included within the scope of the present invention. The present invention also covers the individual isomers of the compounds represented by formula (I) as mixtures with isomers thereof in which one or more chiral centers are inverted. Likewise, it is understood that compounds of formula (I) may exist in tautomeric forms other than that shown in the formula and these are also included within the scope of the present invention.

30

The present invention further provides compounds of formula (I) for use in medical therapy, e.g. in the treatment or prophylaxis, including suppression of recurrence of symptoms, of a viral disease in an animal, e.g. a mammal such as a human. The compounds of formula (I) are especially useful for the treatment or prophylaxis of viral diseases such as herpes viral infections. Herpes viral infections include, for

example, herpes simplex virus 1 (HSV-1), herpes simplex virus 2 (HSV-2), cytomegalovirus (CMV)) (including CMV in organ transplant patients being treated with immunosuppressants), Epstein Barr virus (EBV), herpes zoster virus (HZV), human herpes virus 6 (HHV-6), human herpes virus 7 (HHV-7), and human herpes virus 8 (HHV-8). Thus, the compounds of the invention are also useful in the treatment or prophylaxis of the symptoms or effects of herpes virus infections.

The compounds of the invention are useful in the treatment or prophylaxis of conditions or diseases associated with herpes virus infections, particularly conditions or diseases associated with latent herpes virus infections in an animal, e.g., a mammal such as a human. By conditions or diseases associated with herpes viral infections is meant a condition or disease, excluding the viral infection per se, which results from the presence of the viral infection, such as chronic fatigue syndrome which is associated with EBV infection; multiple sclerosis which has been associated with herpes viral infections such as EBV and HHV-6, which have been associated with HSV-1 infection. Further examples of such conditions or diseases are described in the background section above.

In addition to those conditions and diseases, the compounds of the present invention may also be used for the treatment or prophylaxis of cardiovascular diseases and conditions associated with herpes virus infections, in particular atherosclerosis, coronary artery disease and restenosis and specifically restenosis following angioplasty (RFA). Restenosis is the narrowing of the blood vessels which can occur after injury to the vessel wall, for example injury caused by balloon angioplasty or other surgical and/or diagnostic techniques, and is characterized by excessive proliferation of smooth muscle cells in the walls of the blood vessel treated. It is thought that in many patients suffering from restenosis following angioplasty, viral infection, particularly by CMV and/or HHV-6 plays a pivotal role in the proliferation of the smooth muscle cells in the coronary vessel. Restenosis can occur following a number of surgical and/or diagnostic techniques, for example, transplant surgery, vein grafting, coronary by-pass grafting and, most commonly following angioplasty.

There is evidence from work done both *in vitro* and *in vivo*, indicating that restenosis is a multifactorial process. Several cytokines and growth factors, acting in concert, stimulate the migration and proliferation of vascular smooth muscle cells (SMC) and production of extracellular matrix material, which accumulate to occlude the blood vessel. In addition growth suppressors act to inhibit the proliferation of SMC's and production of extracellular matrix material.

In addition, compounds of formula (I) may be useful in the treatment or prophylaxis of hepatitis B and hepatitis C viruses, human papilloma virus (HPV) and HIV.

10

The present invention provides a method for the treatment or prophylaxis of a viral infection in an animal such as a mammal (e.g., a human), particularly a herpes viral infection, which comprises administering to the animal a therapeutically effective amount of the compound of formula (I).

15

As used herein, the term "prophylaxis" refers to the complete prevention of infection, the prevention of occurrence of symptoms in an infected subject, the prevention of recurrence of symptoms in an infected subject, or a decrease in severity or frequency of symptoms of viral infection, condition or disease in the subject.

20

As used herein, the term "treatment" refers to the partial or total elimination of symptoms or decrease in severity of symptoms of viral infection, condition or disease in the subject, or the elimination or decrease of viral presence in the subject.

25 As used herein, the term "therapeutically effective amount" means an amount of a compound of formula (I) which is sufficient, in the subject to which it is administered, to treat or prevent the stated disease, condition or infection. For example, a therapeutically effective amount of a compound of formula (I) for the treatment of a herpes virus infection is an amount sufficient to treat the herpes virus infection in the subject.

30

The present invention also provides a method for the treatment or prophylaxis of conditions or diseases associated with herpes viral infections in an animal such as a mammal (e.g., a human), which comprises administering to the animal a therapeutically effective amount of the compound of formula (I). In one embodiment, the present invention provides a method for the treatment or prophylaxis of chronic fatigue syndrome and multiple sclerosis in an animal such as a mammal (e.g., a human), which comprises administering to the animal a therapeutically effective amount of a compound of formula (I). The foregoing method is particularly useful for the treatment or prophylaxis of chronic fatigue syndrome and multiple sclerosis associated with latent infection with a herpes virus.

In another embodiment, the present invention provides a method for the treatment or prophylaxis of a cardiovascular condition such as atherosclerosis, coronary artery disease or restenosis (particularly restenosis following surgery such as angioplasty), which comprises administering to the animal a therapeutically effective antiviral amount of the compound of formula (I).

The present invention further provides a method for the treatment or prophylaxis of hepatitis B or hepatitis C viruses in an animal such as a mammal (e.g., a human), which comprises administering to the animal a therapeutically effective amount of the compound of formula (I).

The present invention further provides a method for the treatment or prophylaxis of human papilloma virus in an animal such as a mammal (e.g., a human), which comprises administering to the animal a therapeutically effective amount of the compound of formula (I).

The present invention further provides a method for the treatment or prophylaxis of HIV in an animal such as a mammal (e.g., a human), which comprises administering to the animal a therapeutically effective amount of the compound of formula (I).

- The present invention also provides the use of the compound of formula (I) in the preparation of a medicament for the treatment or prophylaxis of a viral infection in an animal such as a mammal (e.g., a human), particularly a herpes viral infection; the use of the compound of formula (I) in the preparation of a medicament for the
- 5 treatment of conditions or disease associated with a herpes viral infection; and the use of the compound of formula (I) in the preparation of a medicament for the treatment or prophylaxis of hepatitis B or hepatitis C viruses, human papilloma virus and HIV. In particular, the present invention also provides the use of a compound of formula (I) in the preparation of a medicament for the treatment or prophylaxis of chronic fatigue
- 10 syndrome or multiple sclerosis. In one embodiment, the present invention provides the use of a compound of formula (I) in the preparation of a medicament for the treatment or prophylaxis of cardiovascular disease, such as restenosis and atherosclerosis.
- 15 The compounds of formula (I) are conveniently administered in the form of pharmaceutical compositions. Such compositions may conveniently be presented for use in conventional manner in admixture with one or more physiologically acceptable carriers or diluents.
- 20 While it is possible that compounds of the present invention may be therapeutically administered as the raw chemical, it is preferable to present the active ingredient as a pharmaceutical formulation. The pharmaceutical formulation may include one or more pharmaceutically acceptable carriers or diluents together with the compound of formula (I). The carrier(s) must be "acceptable" in the sense of being compatible with
- 25 the other ingredients of the formulation and not deleterious to the recipient thereof.
- Accordingly, the present invention further provides for a pharmaceutical composition or formulation comprising a compound of formula (I). In one embodiment, the pharmaceutical formulation further comprises one or more pharmaceutically
- 30 acceptable carriers or diluents and, optionally, other therapeutic and/or prophylactic ingredients.

The formulations include those suitable for oral, parenteral (including subcutaneous e.g. by injection or by depot tablet, intradermal, intrathecal, intramuscular e.g. by depot and intravenous), rectal and topical (including dermal, buccal and sublingual) administration although the most suitable route may depend upon for example the condition, age, and disorder of the recipient as well as the viral infection or disease being treated. The formulations may conveniently be presented in unit dosage form and may be prepared by any of the methods well known in the art of pharmacy. All methods include the step of bringing into association the compound(s) ("active ingredient") with the carrier which constitutes one or more accessory ingredients. In general the formulations are prepared by uniformly and intimately bringing into association the active ingredient with liquid carriers or finely divided solid carriers or both and then, if necessary, shaping the product into the desired formulation. Formulations suitable for oral administration may be presented as discrete units such as capsules, cachets or tablets (e.g. chewable tablets in particular for paediatric administration) each containing a predetermined amount of the active ingredient; as a powder or granules; as a solution or a suspension in an aqueous liquid or a non-aqueous liquid; or as an oil-in-water liquid emulsion or a water-in-oil liquid emulsion. The active ingredient may also be presented as a bolus, electuary or paste. A tablet may be made by compression or moulding, optionally with one or more accessory ingredients. Compressed tablets may be prepared by compressing in a suitable machine the active ingredient in a free-flowing form such as a powder or granules, optionally mixed with other conventional excipients such as binding agents, (for example, syrup, acacia, gelatin, sorbitol, tragacanth, mucilage of starch or polyvinylpyrrolidone), fillers (for example, lactose, sugar, microcrystalline cellulose, maize-starch, calcium phosphate or sorbitol), lubricants (for example, magnesium stearate, stearic acid, talc, polyethylene glycol or silica), disintegrants (for example, potato starch or sodium starch glycollate) or wetting agents, such as sodium lauryl sulfate. Moulded tablets may be made by moulding in a suitable machine a mixture of the powdered compound moistened with an inert liquid diluent. The tablets may optionally be coated or scored and may be formulated so as to provide slow or

controlled release of the active ingredient therein. The tablets may be coated according to methods well-known in the art.

Alternatively, the compounds of the present invention may be incorporated into oral
5 liquid preparations such as aqueous or oily suspensions, solutions, emulsions, syrups or
elixirs, for example. Moreover, formulations containing these compounds may be
presented as a dry product for constitution with water or other suitable vehicle before
use. Such liquid preparations may contain conventional additives such as suspending
agents such as sorbitol syrup, methyl cellulose, glucose/sugar syrup, gelatin,
10 hydroxyethylcellulose, carboxymethyl cellulose, aluminum stearate gel or
hydrogenated edible fats; emulsifying agents such as lecithin, sorbitan mono-oleate or
acacia; non-aqueous vehicles (which may include edible oils) such as almond oil,
fractionated coconut oil, oily esters, propylene glycol or ethyl alcohol; and
preservatives such as methyl or propyl p-hydroxybenzoates or sorbic acid. Such
15 preparations may also be formulated as suppositories, e.g., containing conventional
suppository bases such as cocoa butter or other glycerides.

Formulations for parenteral administration include aqueous and non-aqueous sterile
injection solutions which may contain anti-oxidants, buffers, bacteriostats and solutes
20 which render the formulation isotonic with the blood of the intended recipient; and
aqueous and non-aqueous sterile suspensions which may include suspending agents
and thickening agents.

The formulations may be presented in unit-dose or multi-dose containers, for example
25 sealed ampoules and vials, and may be stored in a freeze-dried (lyophilised) condition
requiring only the addition of a sterile liquid carrier, for example, water-for-injection,
immediately prior to use. Extemporaneous injection solutions and suspensions may be
prepared from sterile powders, granules and tablets of the kind previously described.
Formulations for rectal administration may be presented as a suppository with the
30 usual carriers such as cocoa butter, hard fat or polyethylene glycol.

Formulations for topical administration in the mouth, for example buccally or sublingually, include lozenges comprising the active ingredient in a flavoured base such as sucrose and acacia or tragacanth, and pastilles comprising the active ingredient in a base such as gelatin and glycerin or sucrose and acacia.

5

The compounds may also be formulated as depot preparations. Such long acting formulations may be administered by implantation (for example subcutaneously or intramuscularly) or by intramuscular injection. Thus, for example, the compounds may be formulated with suitable polymeric or hydrophobic materials (for example as an emulsion in an acceptable oil) or ion exchange resins, or as sparingly soluble derivatives, for example, as a sparingly soluble salt.

10

In addition to the ingredients particularly mentioned above, the formulations may include other agents conventional in the art having regard to the type of formulation in question, for example those suitable for oral administration may include flavouring agents.

15

It will be appreciated that the amount of a compound of the invention required for use in treatment will vary with the nature of the condition being treated and the age and the condition of the patient and will be ultimately at the discretion of the attendant physician or veterinarian. In general, however, doses employed for adult human treatment will typically be in the range of 0.02-5000 mg per day, preferably 100-1500 mg per day. The desired dose may conveniently be presented in a single dose or as divided doses administered at appropriate intervals, for example as two, three, four or more sub-doses per day. The formulations according to the invention may contain between 0.1-99% of the active ingredient, conveniently from 30-95% for tablets and capsules and 3-50% for liquid preparations.

20

25

The compound of formula (I) for use in the instant invention may be used in combination with other therapeutic agents for example, non-nucleoside reverse transcriptase inhibitors, nucleoside reverse transcriptase inhibitors, protease inhibitors

30

and/or other antiviral agents. The invention thus provides in a further aspect the use of a combination comprising a compound of formula (I) with a further therapeutic agent in the treatment of viral infections. Particular antiviral agents which may be combined with the compounds of the present invention include aciclovir, valaciclovir, famcyclovir, ganciclovir, docosanol, miribavir, amprenavir, lamivudine, zidovudine, and abacavir. Preferred antiviral agents for combining with the compounds of the present invention include aciclovir, famcyclovir and valaciclovir. Thus the present invention provides in a further aspect, a combination comprising a compound of formula (I) and an antiviral agent selected from the group consisting of aciclovir or valaciclovir; the use of such combination in the treatment of viral infections and the preparation of a medicament for the treatment of viral infections, and a method of treating viral infections comprising administering a compound of formula (I) and an antiviral agent selected from the group consisting of aciclovir and valaciclovir.

When the compounds of formula (I) are used in combination with other therapeutic agents, the compounds may be administered either sequentially or simultaneously by any convenient route.

The combinations referred to above may conveniently be presented for use in the form of a pharmaceutical formulation and thus pharmaceutical formulations comprising a combination as defined above optionally together with a pharmaceutically acceptable carrier or diluent comprise a further aspect of the invention. The individual components of such combinations may be administered either sequentially or simultaneously in separate or combined pharmaceutical formulations.

When combined in the same formulation it will be appreciated that the two compounds must be stable and compatible with each other and the other components of the formulation and may be formulated for administration. When formulated separately they may be provided in any convenient formulation, in such a manner as are known for such compounds in the art.

When a compound of formula (I) is used in combination with a second therapeutic agent active against the viral infection, the dose of each compound may differ from that when the compound is used alone. Appropriate doses will be readily appreciated by those skilled in the art.

Generally, the process for preparing the compounds of formula (I) wherein Y is N and R³ and R⁴ are both H, (all formulas and all other variables having been defined above in connection with Scheme 1) comprises the steps of:

- 20 (a) reacting a picoline compound of formula (III) with a benzoylating agent of formula (II) to prepare the compound of formula (IV);
- (b) reacting the compound of formula (IV) with a hydroxylamine source to prepare a compound of formula (V);
- (c) reacting the compound of formula (V) with an acylating or sulfonylating agent
- 25 to prepare a compound of formula (VI);
- (d) rearranging the compound of formula (VI) to prepare a compound of formula (VII);
- (e) acylating the compound of formula (VII) to prepare a compound of formula (VIII);
- 30 (f) reacting the compound of formula (VIII) with a dimethylformamide dialkyl acetal of formula (CH₃)₂NCH(ORa)₂ to prepare a compound of formula (IX); and

(g) reacting the compound of formula (IX) with a compound of formula (X) to prepare the compounds of formula (I) or a pharmaceutically acceptable salt, solvate or physiologically functional derivative thereof.

- 5 More specifically, compounds of formula (I) wherein Y is N and R³ and R⁴ are both H, can be prepared by reacting a compound of formula (IX) with a compound of formula (X) to prepare a compound of formula (I) or a pharmaceutically acceptable salt, solvate or physiologically functional derivative thereof.

- 15 wherein all variables are as defined above in connection with Scheme 1.

This general method can be readily carried out by mixing a compound of formula (IX) with a compound of formula (X) in a suitable solvent, optionally in the presence of a base (preferably when the amidine is in a salt form), and heating the reaction to 50-
 20 150°C. Typical solvents include lower alcohols such as methanol, ethanol, isopropanol and the like and dimethylformamide, 1-methyl-2-pyrrolidinone and the like. The base is typically a sodium alkoxide, potassium carbonate, or an amine base such as triethylamine. In one embodiment, the solvent is dimethylformamide or 1-methyl-2-pyrrolidinone and the base is potassium carbonate, or an amine base such as
 25 triethylamine.

The compounds of formula (X) can be prepared according to conventional methods. One preferred method for preparing the compounds of formula (X) (adapted from WO 00/78731) involves heating an appropriately substituted aniline of the formula (XI) with cyanamide in the presence of a protic acid in an alcohol solvent.

This method is adapted from the procedures described in WO 00/78731 published 28 December 2000, the subject matter of which is incorporated herein by reference in its entirety. Preferred acids include but are not limited to hydrochloric acid, nitric acid, and sulfuric acid. Suitable solvents will be readily apparent to those skilled in the art and include, for example, ethanol.

15

Compounds of the formula (IX) may be conveniently prepared by reacting a compound of formula (VIII) with a dimethylformamide dialkyl acetal, wherein R_a is alkyl or cycloalkyl.

20

25

wherein all variables are as defined above in connection with Scheme 1.

Typical dimethylformamide dialkylacetal compounds for use in this method include but are not limited to dimethylformamide dimethylacetal and dimethylformamide di-*tert*-butylacetal. In certain embodiments of compounds of formula (I) wherein R^1 is selected from the group consisting of $-NR^7R^8$, $-NHR^{10}Ay$, $-NR^7Ay$, $-NHHet$, $-NHR^{10}Het$ and Het are desired, it may be advantageous to convert a compound of formula (VIII) wherein R^1 is halo (i.e., compounds of formula (VIII-A)) to another compound of formula (VIII) wherein R^1 is an amine-linked substituent (i.e., compounds of formula (VIII-B)) before proceeding with the reaction of the compound of formula (VIII) with the dimethylformamide dialkylacetal compounds to prepare the compounds of formula (IX). A particularly useful method of converting a compound of formula (VIII-A) to a compound of formula (VIII-B) involves replacing a 7-halo with an amine.

20
25

wherein R^1 is defined above and all other variables are as defined in connection with Scheme 1.

Typically the replacement is carried out by mixing the compound of formula (VIII-A) with an amine nucleophile of formula R^1 where R^1 is selected from the group consisting of $-NR^7R^8$, $-NHR^{10}Ay$, $-NR^7Ay$, $-NHHet$, $-NHR^{10}Het$ and Het ; and optionally heating the reaction.

The reaction can also be carried out via an adaptation of procedures found in the literature (Wolfe, J. P.; Buchwald, S. L. *J. Org. Chem.* 2000, 65, 1144) wherein a compound of the general formula (VIII-A) is treated with an amine, a palladium (0) or nickel (0) source and a base in a suitable solvent. Suitable sources of palladium (0) include but are not limited to palladium(II) acetate and tris(dibenzylideneacetone) dipalladium (0). Typical bases for use in the reaction include, for example sodium *tert*-butoxide and cesium carbonate. Toluene is an example of a suitable solvent.

Compounds of formula (VII) are conveniently prepared by rearranging an azirine compound of formula (VI).

wherein all variables are as defined above in connection with Scheme 1.

25

The rearrangement of the azirines of formula (VI) can be accomplished by heating a solution of the azirine of formula (VI) in a suitable solvent at a temperature of about 160–200°C. Suitable inert solvents include, but are not limited to, 1-methyl-2-pyrrolidinone, and 1,2,4-trichlorobenzene. A more preferred method for rearrangement of the azirine of formula (VI) to compounds of formula (VII) involves reacting the compound of formula (VI) with ferrous chloride ($FeCl_2$) or ferric chloride

30

(FeCl₃). This reaction is typically done in an inert solvent with heating. A preferred solvent for this reaction is 1,2-dimethoxyethane and the like.

Typically the azirines of formula (VI) are prepared from oxime compounds of formula (V) by treatment with acylating or sulfonylating agents in the presence of a base.

wherein all variables are as defined above in connection with Scheme 1.

Typical acylating or sulfonylating agents include but are not limited to, acetic anhydride, trifluoroacetic anhydride, methanesulfonyl chloride, toluenesulfonyl chloride and the like. Typical bases include, but are not limited to, triethylamine, diisopropylethylamine, pyridine, and the like. The reaction may be carried out in an inert solvent such as for example, chloroform, dichloromethane, toluene or the like.

The oxime compounds of formula (V) are readily prepared by treating ketone compounds of formula (IV) with a hydroxylamine source, in a suitable solvent, and optionally with a base.

wherein all variables are as defined above in connection with Scheme 1.

Preferably the hydroxylamine is hydroxylamine hydrochloride and the base is an aqueous solution of sodium hydroxide. Suitable solvents include lower alcohols such as methanol, ethanol, or isopropanol.

The ketone compounds of formula (IV) can be prepared by treatment of a picoline compound of formula (III) with a benzoylating agent of formula (II) in the presence of a base.

wherein all variables are as defined above in connection with Scheme 1.

10 The benzoylating agents of formula (II) and the picoline compounds of formula (III) are commercially available or may be prepared using conventional methods known to those skilled in the art. Preferred benzoylating agents of formula (II) include, but are not limited to, benzoyl esters. An example of a suitable base is lithium bis(trimethylsilyl)amide in an inert solvent such as tetrahydrofuran.

15

Generally, the process for preparing compounds of formula (I), and pharmaceutically acceptable salts, solvates and physiologically functional derivatives thereof (all formulas and variables having been defined above in connection with Scheme 4), comprises the following steps:

- 20 (a) halogenating a compound of formula (VII) to prepare a compound of formula (XIX); and
- (b) reacting a compound of formula (XIX) with a compound of formula (XX) to prepare a compound of formula (I) or a pharmaceutically acceptable salt, solvate or physiologically functional derivative thereof.

25

More specifically, compounds of formula (I), and pharmaceutically acceptable salts, solvates and physiologically functional derivatives thereof can be prepared by reacting a compound of formula (XIX) with a compound of formula (XX).

wherein all variables are as defined above in connection with Scheme 4.

10

The reaction may be carried out in an inert solvent, in the presence of a palladium (0) or nickel (0) catalyst. The reaction may optionally be heated to about 50–150°C. Preferably the reaction is performed by reacting equimolar amounts of a compound of formula (XIX) with a Het-metal compound of formula (XX), but the reaction may also be performed in the presence of an excess of compound of the formula (XX). The palladium or nickel catalyst is preferably present in 1–10 mol% compared to the compound of formula (XIX). Examples of suitable palladium catalysts include but are not limited to, tetrakis(triphenylphosphine)palladium (0), dichlorobis(triphenylphosphine)palladium(II), tris(dibenzylideneacetone)dipalladium (0), and bis(diphenylphosphinoferrocene)palladium (II) dichloride. Suitable solvents include but are not limited to, *N,N*-dimethylformamide, toluene, tetrahydrofuran, dioxane, and 1-methyl-2-pyrrolidinone. When the Het-metal compound of formula (XX) is a boronic acid or ester or a borinate the reaction is more conveniently carried out by adding a base in a proportion equivalent to, or greater than, that of the compound of formula (XX). Het-metal compounds of formula (XX) may be obtained from commercial sources or prepared either as discrete isolated compounds or generated *in situ* using methods known to one skilled in the art. (Suzuki, A. *J. Organomet. Chem.* 1999, 576, 147; Stille, J. *Angew. Chem. Int. Ed. Engl.* 1986, 25, 508; Snieckus, V. *J. Org. Chem.* 1995, 60, 292.)

30

Compounds of formula (XIX) can be prepared from compounds of formula (VII) by a halogenation procedure.

wherein all variables are as defined above in connection with Scheme 4.

Typically, the halogenation reaction is carried out by subjecting the compounds of formula (VII) to a halogenating agent in a suitable solvent. Suitable halogenating agents include but are not limited to, *N*-bromosuccinimide, trialkylammonium tribromides, bromine, *N*-chlorosuccinimide, *N*-iodosuccinimide, iodine monochloride, and the like. Suitable solvents include, for example, *N,N*-dimethylformamide, tetrahydrofuran, dioxane, 1-methyl-2-pyrrolidinone, carbon tetrachloride, toluene, dichloromethane, diethyl ether, and the like.

10
15

The compounds of formula (VII) can be prepared using methods described above in connection with Scheme 1.

As will be apparent to those skilled in the art, the compounds of formula (I) may be converted to other compounds of formula (I) using techniques well known in the art. As an example, compounds of formula (I-A) may be converted to compounds of formula (I-B) using either of two methods.

20

wherein M^3 is $B(OH)_2$, $B(ORa)_2$, $B(Ra)_2$, $Sn(Ra)_3$, Zn-halide, Zn-Ra or Mg-halide, Ra is alkyl or cycloalkyl and halide is halo; and all other variables are as defined above in connection with any of the processes described above.

- 5 Such a method can be carried out using the reaction and conditions described above in connection with Scheme 1 and the conversion of compounds of formula (VIII-A) to compounds of formula (VIII-B). Thus, the present invention provides a process for converting compounds of formula (I-A) to compounds of formula (I-B) which comprises either: (1) replacing the C-7 halogen of the compound of formula (I-A) with
 10 an amine; or (2) coupling the compound of formula (I-A) with an aryl metal of the formula $Ay-M^3$ where M^3 is $B(OH)_2$, $B(ORa)_2$, $B(Ra)_2$, $Sn(Ra)_3$, Zn-halide, Zn-Ra or Mg-halide.

- As a further example, compounds of formula (I-C) may be converted to compounds of formula (I-D) by reduction of a nitro group using conventional techniques known to
 15 those skilled in the art.

- wherein q'' is 0, 1, 2, 3 or 4; and all other variables are as defined above in connection
 25 with any of the processes described above.

- The reduction can conveniently be carried out by using zinc, tin or iron and acid, by using tin(II)chloride, or by using palladium or platinum catalysts under hydrogen atmosphere in a suitable solvent as obvious to one skilled in the art of organic
 30 synthesis.

Compounds of formula (I-D) may be further converted to compounds of formula (I-E) by diazotization followed by a Sandmeyer reaction.

10 wherein q'' is 0, 1, 2, 3 or 4; and all other variables are as defined above in connection with any of the processes described above.

The diazotization/Sandmeyer sequence can be typically carried out by treating a compound of formula (I-D) with a nitrite source followed by treatment with a
 15 nucleophile. Sources of nitrite include but are not limited to sodium nitrite and *tert*-butyl nitrite. A representative nucleophile is sodium azide. A typical solvent is aqueous acetic acid. Other Sandmeyer variations will be obvious to those skilled in the art.

20 As a further example of converting compounds of formula (I) into other compounds of formula (I), compounds of formula (I-F) (i.e., compounds of formula (I) wherein q is 1 or more and at least one R^5 is O-methyl) may be converted to compounds of formula (I-G) (i.e., compounds of formula (I) wherein q is 1 or more and at least one R^5 is -OH) using conventional demethylation techniques. Additionally, compounds of formula (I-
 25 G) may optionally be converted to compounds of formula (I-H) (i.e., compounds of formula (I) wherein q is 1 or more and at least one R^5 is -OR¹⁰). For example, the foregoing conversions are represented schematically as follows:

- 15 wherein q' is 0, 1, 2, 3 or 4; and all other variables are as defined above in connection with any of the processes described above.

The demethylation reaction may be carried out by treating a compound of formula (I-F) in a suitable solvent with a Lewis acid at a temperature of -78°C to room temperature, to produce a compound of formula (I-G). Typically the solvent is an inert solvent such as dichloromethane, chloroform, acetonitrile, toluene and the like. The Lewis acid may be boron tribromide, trimethylsilyl iodide and the like.

25 Optionally, the compounds of formula (I-G) may be further converted to compounds of formula (I-H) by an alkylation reaction. The alkylation reaction may be carried out by treating a compound of formula (I-G) in suitable solvent with an alkyl halide of formula R¹⁰-Halo where R¹⁰ is as defined above, to form another compound of formula (I-H). The reaction is preferably carried out in the presence of a base and with optionally heating to 50-200°C. The reaction may be carried out in solvents such as N,N-dimethylformamide, dimethylsulfoxide and the like. Typically the base is potassium carbonate, cesium carbonate, sodium hydride or the like. Additionally, as

30

will be apparent to those skilled in the art, the alkylation reaction can be carried out under Mitsunobu conditions.

In yet another example, compounds of formula (I-I) (i.e., compounds of formula (I) wherein q is 1 or more and at least one R⁵ is halo) or compound of formula (I-J) (i.e. compounds of formula (I) wherein q is 1 or more and at least one R⁵ is nitro) can be converted to compounds of formula (I-K) (i.e., compounds of formula (I) wherein q is 1 or more and at least one R⁵ is NH₂). Optionally, compounds of formula (I-K) may then be converted to compounds of formula (I-L) (i.e., compounds of formula (I) wherein q is 1 or more and at least one R⁵ is -NR⁷R⁸ where R⁷ and R⁸ are not both H). For example, the foregoing conversions are represented schematically as follows:

wherein q'' is 0, 1, 2, 3 or 4; and all other variables are as defined above in connection with any of the processes described above.

- The process of converting compounds of formula (I-I) to compounds of formula (I-K) is carried out by reacting a compound of general formula (I-I) with an imine in the presence of a palladium (0) source, a base and a suitable ligand, followed by hydrolysis to give a compound of formula (I-K). See J. Wolfe, et al., *Tetrahedron Letters* 38:6367-6370 (1997). Typically the imine is benzophenoneimine, the palladium (0) source is tris(dibenzylideneacetone)dipalladium(0), the base is sodium *tert*-butoxide and the ligand is *racemic*-2,2'-bis(diphenylphosphino)-1,1'-binaphthyl. Suitable solvents include *N,N*-dimethylformamide and the like.
- Compounds of formula (I-K) can also be obtained from compounds of formula (I-J) by reduction. The reduction can conveniently be carried out by using zinc, tin or iron and acid, by using tin(II)chloride, or by using palladium or platinum catalysts under hydrogen atmosphere in a suitable solvent as obvious to one skilled in the art of organic synthesis.
- Reaction of a compound of formula (I-K) with compound of formula R^7 -halogen in a suitable solvent in the presence of base, optionally with heating may be used to prepare compounds of formula (I-L). Typically the base is triethylamine or pyridine and the solvent is *N,N*-dimethylformamide and the like.
- Additional compounds of formula (I-L) can be obtained by reductive amination of compounds of formula (I-K) with ketones or aldehydes. See, A. Abdel-Magid, et al., *J. Org. Chem.* 61:3849-3862 (1996). Typically a compound of formula (I-K) is treated with an aldehyde or a ketone in the presence of an acid, such as acetic acid, and a reducing agent, such as sodium triacetoxyborohydride and the like, in an inert solvent such as dichloroethane and the like.
- Other transformations well known to those skilled in the art for use with anilines may be used to convert compounds of formula (I-K) to compounds of formula (I-L). In addition it will be obvious to those skilled in the art that the above mentioned conversions regarding R^5 substituents would be expected to be equally applicable to

any substituted aromatic position in general formula (I) for use in the synthesis of additional compounds of formula (I).

In a further embodiment of the present invention, certain compounds of formula (I-M) may be converted to other compounds of formula (I) (i.e., compounds of formula (I-N) by a deprotonation/electrophile quench protocol. It will be apparent to one skilled in the art that compounds of the formula (I-M) wherein s is 0 can be prepared according to the methods described in Schemes 1 through 4. The compounds of formula (I-M) can be converted to compounds of formula (I-N) by reaction of a compound of formula (I-M) with a base, such as n-butyllithium, followed by reacting with an electrophilic agent.

wherein E is R^1 and all other variables are as defined above in connection with any of the processes described above.

Electrophiles which may be used in this process include, but are not limited to: alkyl halides (E = methyl, benzyl etc.); N-bromosuccinimide (E = bromine); N-chlorosuccinimide (E = chlorine); carbon tetrachloride (E = chlorine); N-iodosuccinimide (E = iodine); iodine (E = iodine); aldehydes (E = $\text{CH}(\text{OH})\text{R}^{10}$); dimethylformamide (E = CHO); dimethyl disulfide (E = SMe); diethyl disulfide (E = SEt); carbon dioxide (E = CO_2H); dimethylcarbamoyl chloride (E = $\text{C}(\text{O})\text{NMe}_2$) and the like.

Each of the foregoing processes may further comprise the step of converting the compounds of formula (I) to a salt, solvate, or physiologically functional derivative thereof, using techniques well known to those skilled in the art.

Based upon this disclosure and the examples contained herein one skilled in the art can readily convert compounds of formula (I) or a pharmaceutically acceptable salt, solvate or physiologically functional derivative thereof into other compounds of formula (I), or salts, solvates or physiologically functional derivatives thereof.

5

The present invention also provides radiolabeled compounds of formula (I). Radiolabeled compounds of formula (I) can be prepared using conventional techniques. For example, radiolabeled compounds of formula (I) can be prepared by reacting the compound of formula (I) with tritium gas in the presence of an appropriate catalyst to produce radiolabeled compounds of formula (I).

10

In one preferred embodiment, the compounds of formula (I) are tritiated. The radiolabeled compounds of formula (I) are useful in assays for the identification of compounds for the treatment or prophylaxis of viral infections such as herpes viral infections. Accordingly, the present invention provides an assay method for identifying compounds which have activity for the treatment or prophylaxis of viral infections such as herpes viral infections, which method comprises the step of specifically binding the radiolabeled compound of formula (I) to the target protein. More specifically, suitable assay methods will include competition binding assays. The radiolabeled compounds of formula (I) can be employed in assays according to the methods conventional in the art.

Plates were incubated up to 14 days at room temperature in a humidified chamber to prevent evaporation.

(b) Preparation of detection DNA.

For the detection probe, a gel-purified, digoxigenin-labeled, 710-bp PCR fragment of the HSV UL-15 sequence was utilized. PCR conditions included 0.5 µM primers, 180 µM dTTP, 20 µM dUTP-digoxigenin (Boehringer Mannheim 1558706), 200 µM each of dATP, dCTP, and dGTP, 1X PCR Buffer II (Perkin Elmer), 2.5 mM MgCl₂, 0.025 units/µL of AmpliTaq Gold polymerase (Perkin Elmer), and 5 ng of gel-purified HSV DNA per 100 µL. Extension conditions were 10 min at 95°C, followed by 30 cycles of 95°C for 1 min, 55°C for 30 sec, and 72°C for 2 min. The amplification was completed with a 10-min incubation at 72°C. Primers were selected to amplify a 728 bp probe spanning a section of the HSV1 UL15 open reading frame (nucleotides 249-977). Single-stranded transcripts were purified with Promega M13 Wizard kits. The capture DNA plasmid (HSV UL13 region in pUC) was linearized by cutting with Xba I, denatured for 15 min at 95°C and diluted immediately into Reacti-Bind DNA Coating Solution (Pierce, 17250, diluted 1:1 with TE buffer, pH 8) at 1 ng/µL. 75 µL/well were added to Corning (#3922 or 9690) white 96-well plates and incubated at room temperature for at least 4 hrs before washing twice with 300 µL/well 0.2X

SSC/0.05% Tween-20 (SSC/T buffer). The plates were then incubated overnight at room temperature with 150 μ L/well 0.2 N NaOH, 1% IGEPAL and 10 μ g/mL herring sperm DNA.

Twenty-seven (27) μ L of cell lysate was combined with 45 μ L of hybridization solution (final concentration: 3M GuSCN, 50 mM EDTA, 100 μ g/ml salmon sperm DNA, 5X Denhardt's solution, 0.25X APE, and 5 ng of the digoxigenin-labeled detection probe). APE is 1.5 M NH_4 -acetate, 0.15 M ammonium phosphate monobasic, and 5 mM EDTA

The wells were washed 6X with 300 μ L/well SSC/T buffer then incubated with 75 μ L/well anti-digoxigenin- HRP-conjugated antibody (Boehringer Mannheim 1207733, 1:5000 in TE) for 30 min at room temperature. The
15 wells were washed 6X with 300 μ L/well with PBS/0.05% Tween-20 before 75 μ L/well SuperSignal LBA substrate (Pierce) was added. The plates were incubated at room temperature for 30 minutes and chemiluminescence was measured in a Wallac Victor reader.

INTERNATIONAL SEARCH REPORT

International application No.
PCT/US 01/44210

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:

Although claims 23 - 25 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. ☐ Claims Nos.:
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this International application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

☐ The additional search fees were accompanied by the applicant's protest.

☐ No protest accompanied the payment of additional search fees.
